

First Choice Solutions®

**abis**  
precision ball bearings

## About IEC

IEC was founded in 1938 to bring to the United Kingdom engineering developments made elsewhere in the World.

Today we serve a broad band of industry with a wide range of quality products.

These are manufactured by companies of international repute who are each specialists in their own field.

We are approved to ISO 9001.

### Your benefits in working with us are

- Competitive and cost effective solutions
- Engineering support for you when needed
- Large stocks available with same day despatch
- Easy to deal with - our experienced, informative staff will give you fast, effective and friendly service
- No surprises - we listen and communicate
- No voicemail - personal contact
- Honest approach to warranty issues
- We treat you as an everlasting customer

Our success is built on our ability to provide our customers with quality products and standards of service that meet or exceed their expectations.

**Our aim is to provide an unrivalled service by getting it right first time and every time thereafter.**

*... the team that cares*

**Integrity • Expertise • Commitment**

## Bearing Reference System

## Precision Ball Bearings

### Cages

Steel Ribbon Type	J
Steel Crown Type	W
Nylon Crown Type	TW
Steel Rivet Type	RJ
Full Complement	V
Thrust FM Type	TP
Thrust F Type	TD

### Materials

Carbon Chrome  
SAE 52100.  
All Types - No Symbol

Stainless Steel  
AISI 440C.  
*Refer to page 18*

Standard metric H  
Imperial & MR series metric S

### Closures

Metallic Shield (Removable)	ZZS
Metallic Shields	ZZ
Rubbing Seals	2RS
Non-Rubbing Seals	2RU
Rubbing Seals (Teflon)	TTs

**Radial Play**

Miniature (Up to 10mm bore)	MC1, MC2, MC3, MC4, MC5, MC6. NOTE: MC3 is default Standard unless otherwise stated.
Standard (10mm + bore)	C2 Normal, C3, C4, C5

*Refer to page 20*

Example 1			6800	H	ZZ	MC2	3	SRL
Example 2	S	MR	74		W	ZZS	MC3	P6 AF2
Example 3	S	FR	133		T		MC4	1 SRL
Example 4	S	FR	8		J		C3	SRL
Example 5			F3-8M		TP			AF2

### Types

Inch	R
Inch, flanged	FR
Inch, extended inner	RW
Inch, extended inner, flanged	FRW
Metric (600 series)	No Symbol
Metric, flanged (600 series)	F
Metric	MR
Metric, flanged	MF
Extra Thin Metric type	ET
Extra Thin Inch type	ER
Thrust with Raceway	FM
Thrust without Raceway	F

*Refer to page 16*

### Frame Sizes

Oil Aeroshell Fluid 12 AF2  
Grease Multemp SRL SRL  
*For other lubricants refer to page 22*

### Tolerances

ABEC 1	No symbol
ABEC 3	3
ABEC 5	5
ISO Class 0	P0
ISO Class 6	P6
ISO Class 5	P5
AFBMA Class 3P	A3P
AFBMA Class 5P	A5P

*Refer to page 26*

Our **ABIS** range covers precision ball bearings manufactured to ABEC 1 to ABEC 5 tolerances and with bore dimensions ranging from 0.6mm - 90mm.

### These are available in

- Metric and imperial sizes
- Open, shielded and sealed
- With and without flange
- High carbon chrome and stainless steel
- Full complement
- Ceramic balls

All **ABIS** precision ball bearings are produced by well established partners specialising in the manufacture of precision ball bearings approved to ISO 9001.

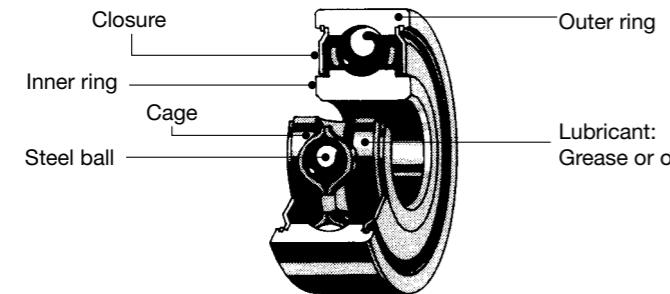

IEC has been closely involved with ball bearing applications in many different industries since 1938. A large stock of ABIS precision ball bearings and bearing accessories is available at our Poole premises.

## Ball Bearings

### Bearing Structure

Rolling element bearings consist of ball, roller or needle elements located between two metal rings which are then free to rotate relative to each other. They offer certain advantages over plain bushes without the higher costs of more sophisticated fluid bearings.

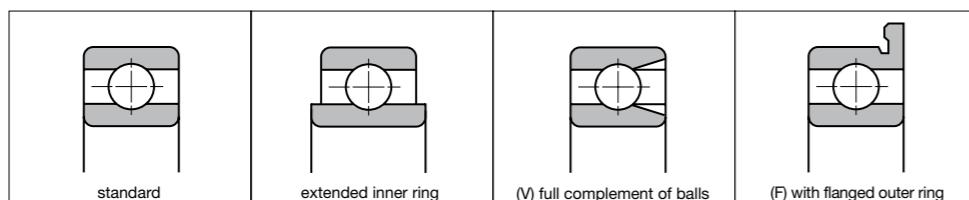

Ball bearings benefit over plain bearings in terms of torque levels, rotational accuracy and speed capability. In their standard form they can support both radial and axial loads.

### Design and Characteristics of Radial Ball Bearings

In the majority of applications the size of the ball bearing is selected according to space considerations. Usually the load capacity which the selected bearing provides is more than adequate for the continuous loads to which it is subjected. In extreme cases, or where severe vibration or shock loading is known to occur, the load carrying capability should be checked.

The form which the bearing takes is entirely determined by the overall design philosophy.

- Open or closed - is the bearing likely to become contaminated? Is escape or outgassing of lubricant an issue?
- Normal or extended inner - is there sufficient clearance axially between rotating and stationary components?
- Load - Single row radial ball bearings with balls separated by a cage can support radial loads, axial loads and tilting moments. A full complement V-type ball bearing can support only radial loads and some low axial loads. Generally a full complement bearing is used when a higher radial load is required than the standard bearing provides.

## Ball Bearings

- Speed - Maximum permissible speeds for ball bearings are mainly related to the bearing design and size, cage type, bearing internal clearance, method and type of lubrication, manufacturing accuracy, sealing methods and loads.
- Torque and noise level - Single row radial ball bearings are precision components and have low torque and noise levels.
- Inclination of inner/outer rings - Shaft and housing seats with poor accuracy, fitting errors and shaft bending might cause inclination between the inner and outer rings although the internal clearance of the bearing will permit this to a certain extent. Generally, the maximum permissible inclination between the inner and outer rings is approximately 1 in 300.
- Toughness - Bearings under load deform elastically at the contact point between the rolling element and bearing ring. This is influenced by the bearing type, size, form and load.
- Installation and removal - the single row radial ball bearing is a non-separable bearing. Therefore, shafts and housings should be so designed to enable bearing inspection and replacement when necessary.
- Axial location - improved axial location is obtained with Thrust type bearings.

**Two important internal parameters which must be considered and specified when a bearing is selected are:**

**Radial Play & Internal Clearance** - the total diametrical movement from contact at one side between rings and balls to similar contact at the other side. It is normally stated in increments of tenths of a thousandth of an inch or microns. This parameter effects the torque level, the axial movement, the load carrying capacity, especially in an axial direction and, according to installation, the noise level and smoothness of the bearing. For more information see page 20-21.

**Lubrication** - the choice of oil or grease and the particular type of each, has an influence on the bearing performance. Noise level, speed, environmental temperature, load and life are some of the various factors which should be considered when selecting lubricant.

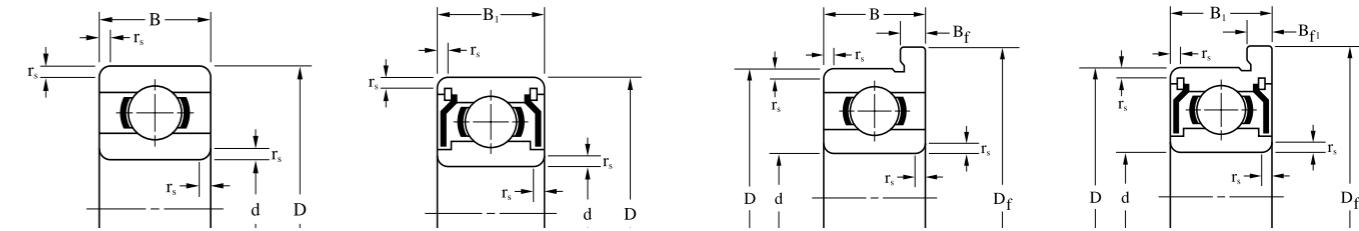

### Installation

To obtain the best performance, certain basic rules should be observed in your installation.

**Keep Parts Clean** - The clearance involved between the balls and tracks is very small and so any dirt particles present in the area of the tracks cause rough, noisy rotation and perhaps even permanent damage.

**Keep Components Round** - The inner and outer rings are generally of fairly thin section and so mating parts must be of good roundness to prevent distortion of the rings with consequent inaccurate rotation and roughness.

**Keep Assemblies Shockfree** - Since radial loads are supported on several contact points, shock loading can result in permanent deformation of the tracks and balls. The resulting craters again give rough, noisy rotation.

\*This dimension is increased by 0.4mm for shielded or seal version.  
Bearings also available with single shield or seal: suffix Z, RS, RU or TS.

Bearings also available with stainless material: suffix S or H.  
TTS<sup>(4)</sup> uses smaller ball, load rating is lower than standard

\*Available with inner ring width extended by 0.0156" (0.3962mm) each side.

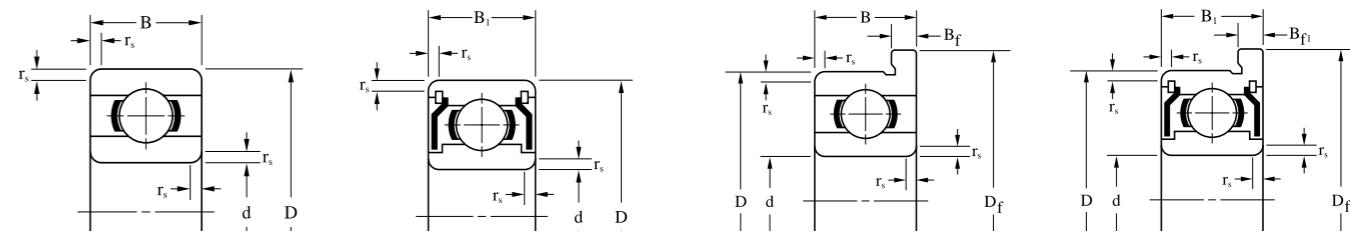

Bearings also available with single shield or seal: suffix Z, RS, RU or TS.

Bearings also available with stainless material: prefix S.

## Technical Data

### Bearing Materials

The standard material for ABIS rings and balls is a vacuum degassed high carbon chromium steel allowing for high efficiency, low torque, low noise level and long bearing life. For bearings requiring anti-corrosion or heat-resistant properties, martensitic stainless steel is used.

Material	Sizes	Designation	Symbol	Chemical Composition (Wt%)						
				C	Si	Mn	P	S	Cr	Mo
Chromium Steel	All	SUJ2 SAE 52100 100Cr6	-	0.95-1.10	0.15-0.35	≤0.50	≤0.025	≤0.025	1.30-1.60	≤0.08
Stainless Steel	d ≤ 25 mm & D ≤ 52 mm	KS440 (ACD34), X65Cr6	S, H	0.95-1.20	≤1.00	≤1.00	≤0.040	≤0.030	16.0-18.0	≤0.75
	d > 25 mm & D ≤ 52 mm	SUS440C, AISI440C, X102CrMo17	S, H	0.60-0.75	≤1.00	≤1.00	≤0.030	≤0.020	11.5-13.0	≤0.030

### Noise Testing

Bearing acoustical noise is a function of both the bearing itself and the way in which it is used. Bearings can be specified as 100% noise-tested during manufacture. Bearing noise is not generally influenced by ABEC precision, but rather by manufacturers' internal quality standards, particularly raceway finish. There are no fixed reference standards among manufacturers for noise testing.

The standard instrument used for bearing noise testing is the Anderon Meter (sometimes called Anderometer) made by Sugawara Laboratories. This measures noise with an accelerometer contacting the outer race of the bearing while the inner race is rotated at 1,800 RPM. Noise levels are separated into 3 bands, designated as follows:

**High band 1,800 - 10,000 Hz      Medium band 300 - 1,800 Hz      Low band 50 - 300 Hz**

According to the type of bearing (material and noise grade), a different attenuation is used for each band. Meters are calibrated in Anderons. Standard testing procedure requires that bearings are washed clean of any lubricant and 2 drops of fresh MIL-L-6085A oil lubricant added prior to testing.

Typical attenuation values for each band are given in the table below, according to bearing material and noise grade. A "pass" for any bearing grade is defined as < 40% of full scale on the Anderon meters for each band. In this case, this translates to pass levels of Low < 6.4, Med < 2.4, High < 3.2.

Anderon Meter Attenuation Settings				
Material	Noise Rating	Low Band	Mid Band	High Band
5100 Chrome Steel	Standard	16	6	8
	EMQ	16	6	8
	EMQ2	12	6	8
440C/Martensitic Stainless	Standard	16	10	24
	EMQ	16	10	24
	EMQ2	16	8	10

**Anderon Meter < 40% = Good Bearing**

### Cages

<b>W One-Piece Steel Crown Type</b>	<b>J Two-piece Steel Ribbon Type</b>	<b>RJ Two-pieces Steel Rivet Type</b>	<b>TW One-piece Nylon Crown Type</b>	<b>Full Complement of Balls</b>

### Closures

<b>ZZ Pressed Steel Shield</b>	<b>ZZS Steel Shield with Snap Ring</b>	<b>TTS Teflon Seal with Snap Ring</b>	<b>2RS Contact Rubber Seal</b>	<b>2RS Non-Contact Rubber Seal</b>

Non-contact shield pressed into outer ring. Very little grease leakage and low ingress of contaminants.

Non-contact shield fixed with snap ring into outer ring. Very little grease leakage and low ingress of contaminants. Mainly used for smaller or narrower bearings. Seal can flex to accommodate internal pressure changes.

Teflon seal reinforced with glass fibre is retained in outer ring by snap ring. Low ingress of contaminants. Mainly used for smaller or narrower bearings. Seal can flex to accommodate internal pressure changes.

Rubber seal fitted into outer ring. Light contact with inner ring, retains grease and prevents ingress of external contaminants.

Non-contact rubber seal fitted into outer ring, still provides effective sealing. NBR SEAL operating temperature range:from -40 to +120°C FKM(VITON)SEAL operating temperature range:from -50 to +230°C

## Technical Data

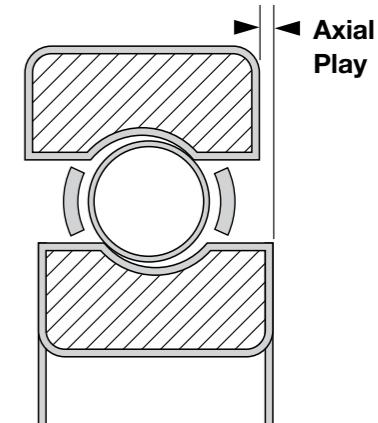

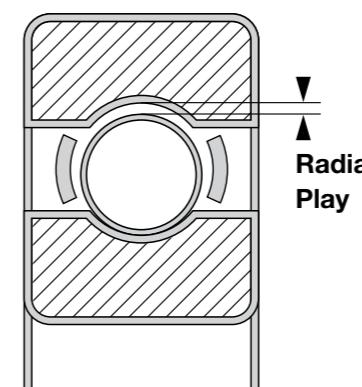

### Radial Play

The radial play of a bearing has considerable influence on its performance. Therefore consideration must be given to the speed, temperature, load, adjacent materials (different coefficients of expansion) and fitting conditions associated with each individual application when selecting the appropriate group. The following notes are given for guidance against the various groups detailed in the table below:

Service Requirements	Radial Play										Remarks		
	Miniature Bearings			Standard Metric Bearings									
	I/D	<10		10 only	10+ -18	18+ -24	24+ -30	30+ -40	40+ -50				
	0.001mm	0.0001"		REF	0.001mm					REF			
Small bearing clearance required axially without the use of preload shims or springs.  Low torque not the prime requirement.  High thrust loads will not occur.	TIGHT	0-5	0-2	MC1	0-7	0-9	0-10	1-11	1-11	1-11	C2  Interference fits must be avoided. Beware differential expansion. Careful attention should be paid to any excessive temperature rise in service.		
		3-8	1-3	MC2									
Moderate torque acceptable.  Moderate thrust loads may occur.	MEDIUM	5-10	2-4	MC3 (std)	2-13	3-18	5-20	5-20	6-20	6-23	CN (CO) std  Interference fits are not recommended.		
		8-13	3-5	MC4	8-23	11-25	13-28	13-28	15-33	18-36	C3		
Minimal torque required. or High thrust load capability.	LOOSE	13-20	5-8	MC5	14-29	18-33	20-36	23-41	28-46	30-51	C4  Moderate interference fits can be applied. Axial play may required to be controlled by shims or springs.		
		20-28	8-11	MC6	20-37	25-45	28-48	30-53	40-64	45-73	C5		

### Internal Clearance

This is generally referred to as radial play although it also incorporates axial play as well because it is actually the amount of space between the rolling elements of the bearing, namely inner ring, outer ring and balls.

**Radial Play** - is clearance perpendicular to the axis of the bearing and better described as the movement available to the outer ring when inner is fixed. This can be more accurately defined as follows: average diameter outer ring raceway minus average diameter of inner ring minus x2 ball diameter.

Radial play is a major consideration when selecting a bearing. Prior to fitting a bearing has an 'initial' amount of play and after being mounted it has a 'residual' radial play (sometimes referred to as operational radial play as it is what is remaining). When a shaft is supported between bearings then consideration needs to be given to the alignment of the bearings as misalignment reduces radial play, therefore it is important that selection accounts for this. There should always be some 'residual' radial play after fitting as this extends bearing life by avoiding skidding and reducing axial play.

There are a number of things that can change radial play during fitting. A tight shaft, larger than the inner ring, will expand the inner ring and this can reduce radial play up to 80% of the interference fit. The same thing happens if the outer ring is larger than the housing diameter, the ring is effectively compressed and reduces radial play in the same way. If there was a temperature difference seen between the shaft and the housing then thermal expansion either on the inner or outer ring, would lead to a reduction in radial play. This may be calculated as opposite:

Another factor to consider relating to thermal expansion is the material that is used for the shaft and housing. For example, a housing material with a higher coefficient of expansion than the bearing material could under certain conditions 'squeeze' the bearing outer ring and reduce radial play.

**Axial Play** - is the opposite of radial play as it is the movement of the rings relative to each other along the axis of the bearing. The amount of axial play is controlled by the bearing raceway curvature but as a general rule is around x10 the value of radial play.

**Chrome Steel** -  $0.0000125 \times (\text{inner ring temp} - \text{outer ring temp } ^\circ\text{C}) \times \text{outer ring raceway diameter in mm}$ .

**440 Stainless Steel** -  $0.0000103 \times (\text{inner ring temp} - \text{outer ring temp } ^\circ\text{C}) \times \text{outer ring raceway diameter in mm}$ .

The outer ring raceway diameter is roughly calculated as:  $0.2 \times (d + 4D)$  where  $d$  is the bore in mm and  $D$  is the outer diameter in mm.

## Lubricants

### Lubricating Oil and Grease

Rotating Speed	Lubricating Oil		Lubricating Grease	
	Low • Medium • High Speed	Low • Medium Speed		
Lubricant Efficiency	Excellent		Good	
Cooling Effect	Good		None	
Torque	Comparatively Low		Comparatively High	
Lubricant Life	Long		Comparatively Short	
Lubricant Replacement	Easy		Difficult	
Lubricant Leakage	Should not be used where oil leakage is unacceptable		Little Grease Leakage	
Impurities Filtration	Easy		Difficult	
Sealing Equipment	Complex		Simple	

### Grease Filling Volume

Symbol	Filling Volume (%)	Operating Condition	
		Speed	Load
M	70±10	Low	Heavy
S	50±10	Low	Medium
G	40±10	Medium	Medium
<b>L Default Standard</b>	<b>30±10</b>	<b>Medium</b>	<b>Medium</b>
Q	25±5	Medium	Medium
K	20±5	High	Light
X	10±5	High	Light

Note: Light load ( $\leq 0.06\text{Cr}$ )  
Standard load ( $\leq 0.12\text{Cr}$ )

### Criteria for Lubricating Oil Selection

Operating Temperature of Bearing ( $^{\circ}\text{C}$ )	dn	ISO Viscosity Grade Lubricating Oil (VG)	
		Medium Load	Heavy Load/Shock Load
-30~0	Up to permissible rotating speed	15, 22, 32	32, 46
0~+60	Up to 15000	32, 46, 68	100
	15000 ~ 80000	32, 46	68
	80000 ~ 150000	22, 32	32
	150000 ~ 500000	10	22, 32
+60~+100	Up to 15000	150	220
	15000 ~ 80000	100	150
	80000 ~ 150000	68	100, 150
	150000 ~ 500000	32	68
+100~+150	Up to permissible rotating speed	320	

Note: 1. If heavy loads occur at low speeds, a higher viscosity lubricating oil should be used.  
2. This table is for oil bath lubrication system and recirculating oil systems.  
3. dn = Bearing bore diameter d (mm) x rotating speed n (r.p.m)

### Common Oil Brands

Code	Brand	Lubricant Base	Viscosity (m <sup>2</sup> /s)	Operating Temperature ( $^{\circ}\text{C}$ )	Approved Standard	Comments
AF2*	Aero Shell Fluid 12	Diester	8.9 (54.4 $^{\circ}\text{C}$ )	-50~+205	MIL-PRF-6085D	Low viscosity, wide temperature range and high operating temperature. Good general purpose oil for instrument/ aircraft applications
AF3	Aero Shell Fluid 3	Mineral	10.0 (38 $^{\circ}\text{C}$ )	-47~+115	MIL-PRF-7870C	Low viscosity, good general purpose oil for instrument/aircraft applications
KAZ	Krytox 143AZ	Fluorinated	12.4 (40 $^{\circ}\text{C}$ )	-54~+149	-	Inert, high temperature capability suitable for low speed/load. Impervious plastics/ elastomers
PD8	Isoflex PDP38	Diester	12.0 (40 $^{\circ}\text{C}$ )	-55~+100	-	Low viscosity, good general purpose oil for instrument/aircraft applications

### Common Grease Brands\*\*

Code	Brand	Thickening Agent	Lubricant Base	Operating Temperature ( $^{\circ}\text{C}$ )	Approved Standard	Comments
SRL*	Multemp SRL	Lithium	Diester, Mineral	-50~+150	-	Good temperature range, load capacity and water resistance
AV2	Alvania 2S	Lithium	Mineral	-25~+120	-	Good temperature range, load capacity and water resistance
AG7	Aero Shell NO.7	Microgel	Diester	-73~+149	MIL-PRF-83282D	Good temperature range, load capacity and water resistance
AG2	Aero Shell NO.22	Microgel	Synthetic Hydrocarbon	-65~+204	MIL-PRF-81322F	Good temperature range, high load/speed capacity and good water resistance
A3S	Aero Shell NO.33MS	Lithium	Synthetic Hydrocarbon Ester	-73~+121	MIL-G-21164D	Low temperature, high load capacity and good water resistance
PS2	Multemp PS NO.2	Lithium	Diester, Mineral	-55~+130	-	Good temperature range, load capacity and water resistance
SL8	Isoflex Super LDS18	Lithium	Diester	-60~+130	MIL-G-7118-A	Good temperature range, load capacity and water resistance
K24	Krytox 240AC	PFPE	Fluorinated	-35~+238	MIL-G-27617	Suitable for high temperature applications,. High viscosity at room temperature
B32	Beacon 325	Lithium	Diester	-60~+120	-	Suitable for low torque/quiet running applications

\* Default lubricant and will be supplied unless otherwise specified.

\*\* If you have a specific requirement for another oil or grease please contact us for advice.

## Technical Data

### Importance of correct fitting of bearings

A bearing can only perform to its full capacity when it is correctly fitted on the shaft and in the housing. Insufficient interference on fitting surfaces could cause bearing rings to creep in a circumferential direction. Once this happens, considerable wear occurs on the fitting surface and both shaft and housing can be damaged. Furthermore, abrasive particles may enter the bearing causing vibration, excessive heat and damage to raceways. It is therefore necessary to provide bearing rings under rotating load with an adequate interference fit to prevent creep. When using thin-type bearings under low load, the bearings should be fastened by a nut. Statically loaded bearings generally do not need to be fitted with an interference fit. Only when subject to a high degree of vibration do both inner and outer rings require fitting with an interference fit.

Fitting of Bearing & Shaft				
Condition (Steel Shaft)		Shaft Bore Diameter	Shaft Tolerance Class	
			Thin-Type	Others
Inner Ring Rotating Load or Indeterminate Load Direction	Light Load $\leq 0.06C$ or Fluctuating Load	10 $\leq d \leq$ 18 18 $\leq d \leq$ 30 30 $\leq d \leq$ 50	h5 h5 h5	js5 js5 js5

### Faults, Causes & Remedies

	Problem	Cause	Remedy
Noise	<b>High pitched metallic noise</b>	Poor lubrication Clearance too small Poor fitting Excessive load	Improve lubrication Correct clearance Investigate mounting method and seating Examine shaft and housing tolerances for closing effect
	<b>Low pitched metallic noise</b>	Brinelled raceway surface	Avoid shock loads
	<b>Regular noise</b>	Rust and damage Flaking of raceway surface	Check and replace seals and relubricate Improve lubrication and check fitting, clearance and fixing method
	<b>Irregular noise</b>	Ingress of foreign matter Excessive clearance Damage and flaking of rolling element	Check and replace seals and relubricate Correct clearance Reduce loads and/or clearance
	<b>Variable noise</b>	Variable clearance due to temperature changes Damage to raceways	Check fits taking housing materials and temperature into consideration Improve lubrication and check fitting, clearance and fixing method
Heavy vibration		Flaking of raceway and rolling element Ingress of foreign matter Excessive clearance Poor location	Improve lubrication and check fitting, clearance and fixing method Check and replace seals and relubricate Correct clearance Ensure abutment face and fitting diameter are perpendicular
Excessive heat generation		Clearance too small Poor location Excessive load Poor lubrication Creep	Correct clearance Ensure abutment face and fitting diameter are perpendicular Examine shaft and housing tolerances for closing effect Improve lubrication Maintain recommended shaft and housing fits
Lubrication failure		Too much grease Ingress of foreign matter	Use the correct lubricant quantity Check and replace seals and relubricate

## Technical Data

### Tolerances

For inch bearings tolerances are based on Section 3 of the AFBMA Standards for ABEC Class1 and Section 12 for ABEC Class 3. Refer to Table 1.

For metric series bearings up to 9 mm outer diameter tolerances are based on AFBMA Standards as above. For diameters over 9 mm they are based on ISO R492-R1648 tolerances Class P0, P6 and P5. Refer to Tables 1 & 2.

N.B. Thin section bearings, Series E only, are available in tolerance Class P5.

## Preload Springs

Preloading of bearings is a process of applying an axial load to either the inner or outer ring of the bearing so that radial play is taken up and running components are in contact. This is seen as good practice as it reduces noise, vibration and ultimately extends bearing life.

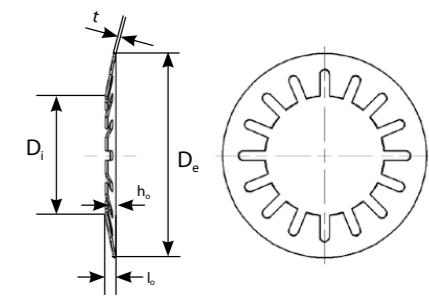

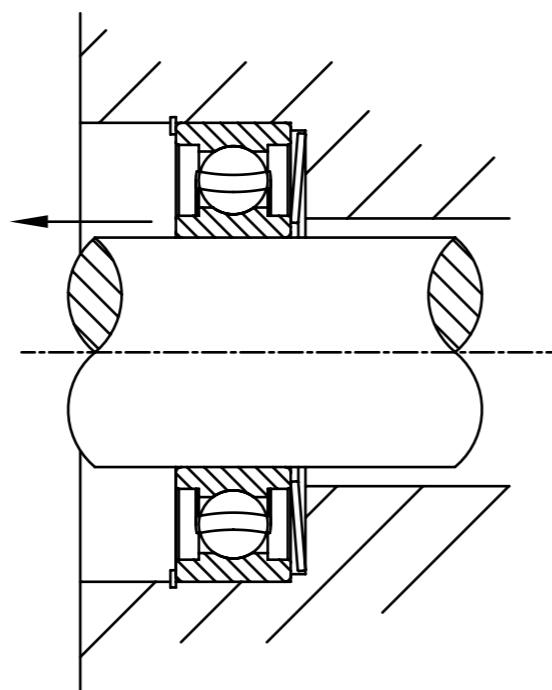

There are essentially two methods to preload a bearing. Firstly, a solid preload such as a threaded plug or circlip, or secondly by a spring, i.e. a disc spring. The disadvantage of a solid preload is that it cannot compensate for tolerance build up or thermal movement of the surrounding components and so running torque may be affected.

The disc spring, as well as applying a constant load around the bearing ring, overcomes the disadvantages of using a solid preload. Where a very light preload is required the disc spring has radial slots to reduce the axial force applied.

### Preloading Outer Race

### Preloading Inner Race

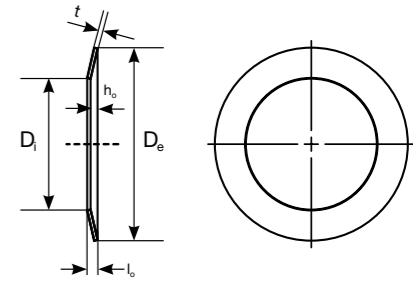

## Preload Springs - Slotted

## Bearing Lock Nuts

The **Fine U-Nut** was developed to simplify the assembly and reduce costs involved in securing Ball Bearings.

The manufacturer has more than 30 years experience in Lock Nut Technology and their factory is ISO 9001 approved.

### Construction & Function

The **Fine U-Nut** is a one piece item where the locking function is performed by a spring peened into the top of the nut. In use the spring bears on the flank of the shaft thread with force P generating reaction P' in the screw threads with a resulting high friction torque (prevailing torque). The nut therefore remains locked in position.

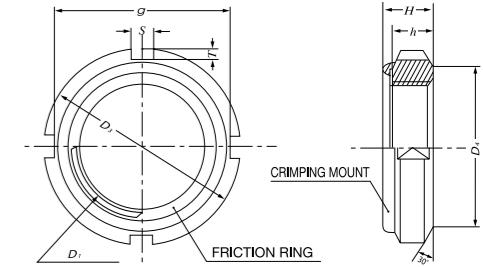

### Key Features:

- Secure locking without keyway and tab washer
- Unique slim body design
- Improved shaft strength and balance
- Simple infinite adjustment
- Re-usable up to 100 times
- Carbon, high carbon and stainless steel versions
- Resists vibration and shock
- Equally effective for rotation in either direction even with rapid reversals
- One piece construction reduces assembly time and stock items

### Materials

Material	JIS	ISO	BS
Low Carbon Steel	SS400 (or equivalent)	1.0044	43B
High Carbon Steel	S45C (or equivalent)	1.0503/1.1191/1.1201	070M46/080M46/080A47
Stainless Steel	SUS304 (or equivalent)	1.4301	304S31

Stainless Steel	SUS304	SUS304	1.4301	1.4301	304S31	304S31

## Other Products

### Thin Section Bearings

- Bore sizes from 1" to 40"
- Precision to ABEC 7
- Radial, angular and 4 point contact versions
- Standard materials - SAE 52100 & 440C
- Shielded and sealed versions
- Duplex and super duplex configurations
- Special materials for hostile environments
- ISO 9001 and AS9100 approved factory

### High Precision Ball Bearings

- Metric and imperial sizes from 1mm to 35mm and .040" - .625" bore
- Precision to ABEC 9
- Angular contact spindle
- Duplex and super duplex
- Special sizes and assemblies
- Hybrid and ceramic
- High corrosion resistant steel X30 CrMon 15-1
- ISO9001 approved factory

### Labyrinth Sealing Rings

- Protect bearings and seals in hot, dirty and abrasive environments
- Simple, cost effective design
- 15mm to 1300mm nominal bore or shaft diameters
- Standard materials to 300°C nickel chrome to 720°C
- Special sizes produced economically
- ISO9001 and TS16949 approved factory

### Disc Springs

- Standard and special sizes from 6mm to 250mm OD
- Special sizes to 1,000mm outside diameter and 80mm thick
- Standard range manufactured from spring steel
- High alloy steels, Nickel and Copper Alloys available for hostile conditions
- Special range for pre-loading bearings
- Manufactured to DIN2092 and DIN2093 standards
- ISO 9001 and TS16949 approved factory

### Safety Washers

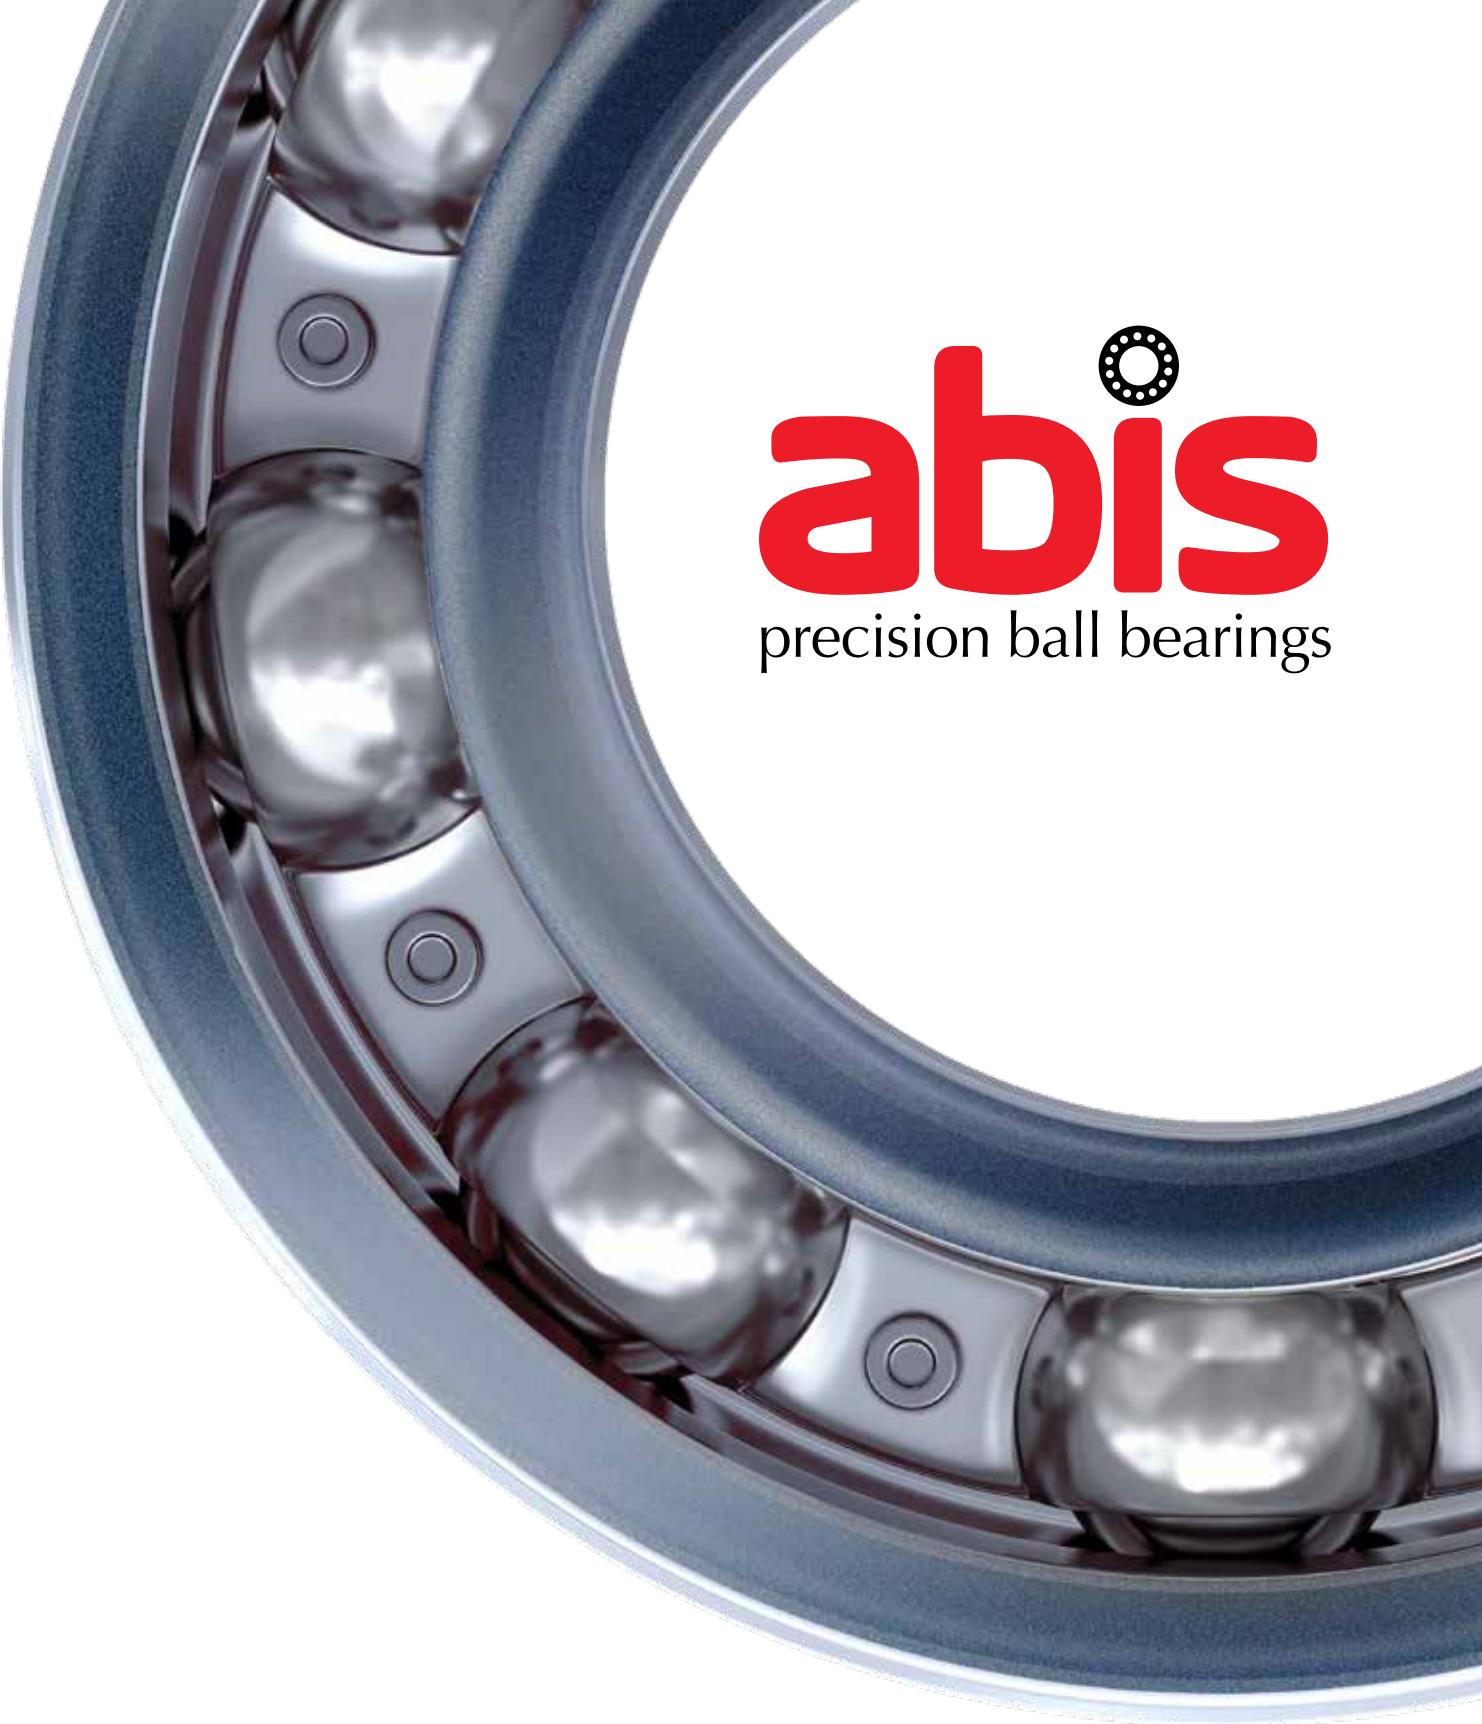

- Reliable and economic vibration resistant washers
- Size range from 1.6mm to 36mm bolt
- Wide range of materials and finishes
- No deformation of fastener stem
- Minimum damage to mating surfaces
- V and VS styles to suit most types of bolts
- ISO 9001 and TS16949 approved factory

### Load Washers

- High axial loads
- Size range from 1.6mm to 36mm bolt
- Wide range of materials and finishes
- No deformation of fastener stem
- Minimum damage to mating surfaces
- HDS and HS styles to suit most types of bolts
- Suitable for captive fitting
- ISO 9001 and TS16949 approved factory
